

AMI LABS

AMI Labs is an AI startup founded by Turing Award-winner Yann LeCun. Recently raising €890 million and valued at €3 billion, it has joined the exclusive circle of French tech unicorns.

AI SYSTEMS

The company develops “world models”, AI systems that learn abstract representations of real-world sensor data—images, videos, and other sensors—while ignoring unpredictable details. These models can predict the consequences of actions, enabling safe planning in complex environments. Applications include robotics, industrial automation, healthcare, and wearable devices.

AI-EDUCATION

Yann LeCun emphasizes that AI will transform engineering education, shifting focus from traditional coding to mathematics, physics, system design, and decision-making. Operating globally from day one, AMI Labs combines cutting-edge research with industrial impact, with a vision that real intelligence starts with understanding the world—not just language.
